THE POWER OF ACTION

Operational Update

Sam Matthews, Data and Analysis Manager
Electricity Operational Forum, August 2011

Agenda

- Overnight Operation

- Wind Curtailment

Operational Update – Overnight Operation

Voltage Standards

- Maintain voltages across the system in line with the National Electricity System Security and Quality of Supply Standards

- Applies to both post-fault and steady state conditions

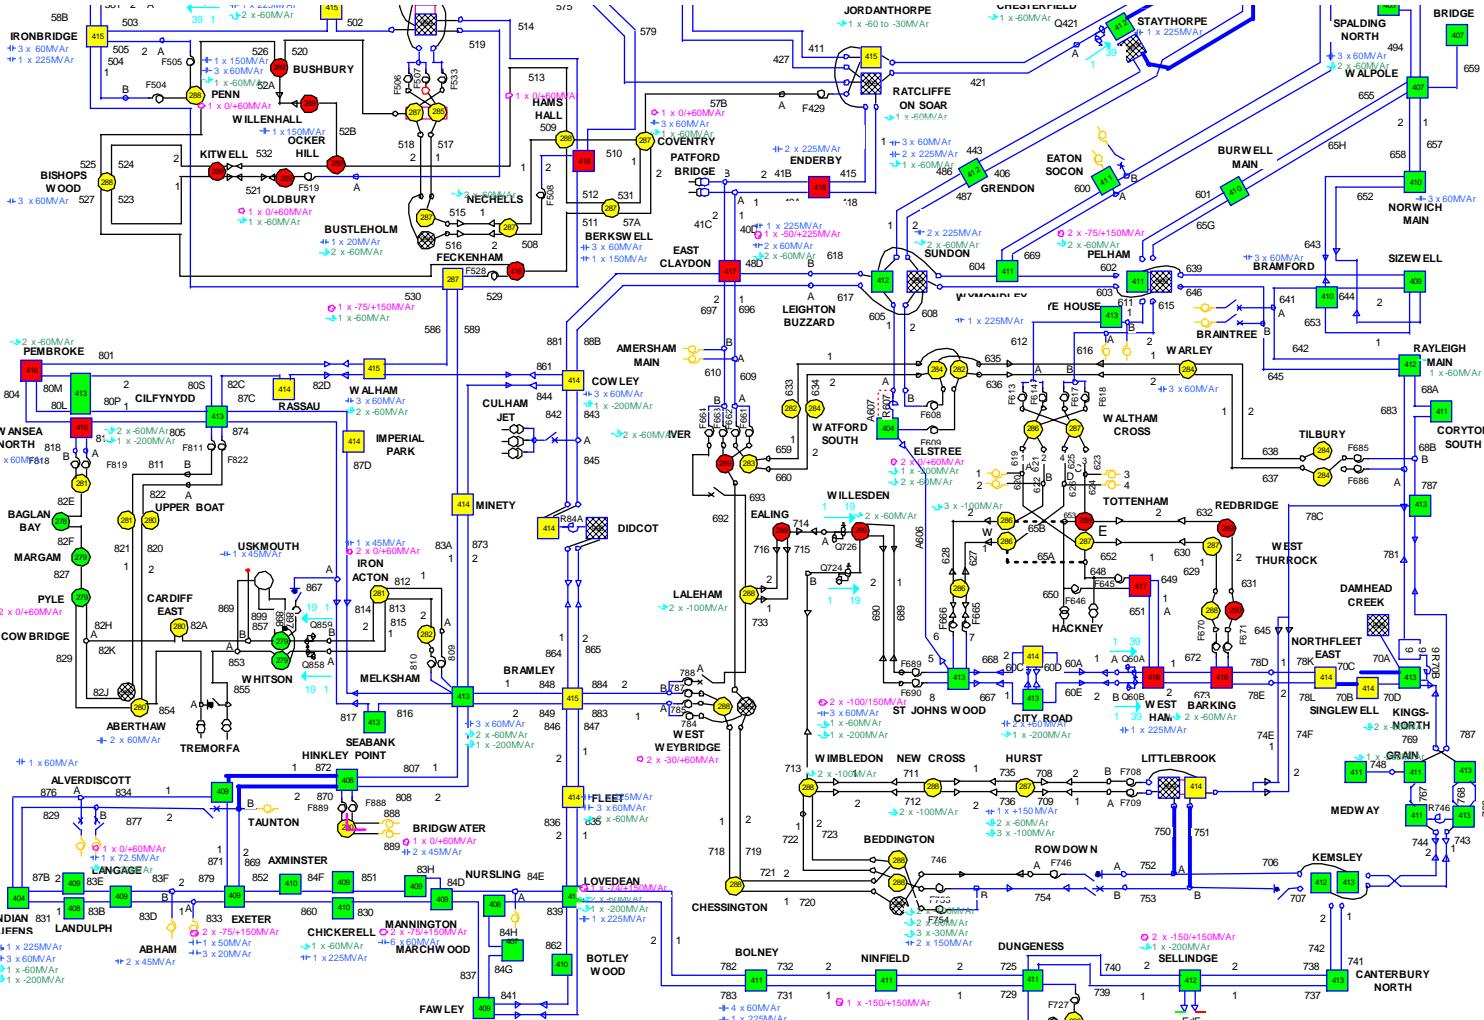

- Requires management of reactive gain and loss across the system and balance of active power generation against demand in a given area

System Gain

- System built for peak demands, low demand leaves lightly loaded circuits
- Lightly loaded circuits :
 - Capacitive effect
 - Particularly cable circuits
 - “generate” MVArS – increases volts

Overnight Operation – Voltage Control

nationalgrid
THE POWER OF ACTION

Overnight Operation – Other considerations

As well as voltage control...

- Ensure sufficient “footroom”
- Ensure sufficient response capability maintained
- Satisfy local transmission constraints
- Complex to manage

Operational Update – Wind Curtailment

Wind Curtailment

Number of Days Wind Output Reduced via BM
