

Potential future modification topics

For TCMF 15th January 2013

	Topic	Description	Raised by
1	G/D split	Consider if changes are required to G/D split in light any changes to tarification rules and to facilitate better competition across Europe. <i>Being taken forward and was brought to Nov 12 TCMF for discussion.</i>	National Grid
2	Embedded	Consider changes to charging arrangements to ensure all users who trade at central hub are exposed to the same transmission signals. <i>Developments to be discussed at Jan 13 TCMF meeting.</i>	National Grid
3	Triad	Review Triad arrangements are still appropriate. Triad provides a strong peak energy signal, through a concentrated transport tariff (locational signal and residual element spread over three peaks).	National Grid
4	Integrated offshore	Review application of the current charging methodology to an integrated offshore grid. <i>National Grid has set up an informal workgroup to explore solutions – work is continuing.</i>	National Grid
5	Fixed tariffs	Consider fixed tariffs. Feedback from RIIO engagement and TCMF is that stability of tariffs is important, although predictability is possibly more important. Cover both TNUoS and BSUoS. <i>On hold until CMP206/207/208 determined.</i>	National Grid
6	Methodology Housekeeping	Non material changes to Section 14 of the CUSC to reflect current governance arrangements. <i>National Grid to review sections that would change once CMP213 determined.</i>	National Grid
7	8 year Price Control	Under an eight year Price Control should charging parameters and zones be updated during the price control period e.g. after four years?	National Grid
